

# NORTHWEST BIOSOLIDS MANAGEMENT ASSOCIATION

## General Membership Meeting & Tour *From Process to Product* July 13, 2006 • Eugene, Oregon

Visitors enter along this driveway bordered by the biosolids drying beds.

Ken Vanderford leads participants on a tour of Eugene's poplar plantation. Liquid biosolids are applied with the hard hose irrigation reel seen in the background.

Attendees visit the Eugene lagoon treatment system.

Eugene/Springfield staff plant a variety of hybrid poplar species as a safeguard against specific plant diseases and pests. They use cuttings from hardy varieties for future plantings.

The tour wouldn't be complete without a preview of the belt filter press operation. Their dried biosolids reach approximately 40-60% solids.
